

HENNECKE PRESSRELEASE

Hennecke at SCANPLAST – Scandinavia's major trade fair for the plastics industry - 4 - 7 April in Gothenburg. Stand C01.40

Focusing on efficiency: Hennecke's new BaseLine

At this year's SCANPLAST, the PU specialists headquartered in Sankt Augustin near Bonn will not only present new PU processing technologies, but also a further development of their BaseLine metering machine.

Hennecke looks back on more than five decades since the first high-pressure reaction casting machines for polyurethane processing were developed. At the SCANPLAST, the spotlight will be on the new BaseLine generation. Within the Bayer subsidiary's delivery programme, the label BaseLine has for a long time been standing for a cost-effective use of high-pressure technology. The further development is intended to convince businesses including small and start-up companies to acquire high-pressure technology. In addition to increasing the output, the engineers' major focus was on efficient utilization. A new, innovative control unit enables the user to implement mixing operations with an output of up to 2800 g/s. The system is equipped with a touchscreen control panel communicating with the operator. However, the purpose of the new machine generation is not only to help the user with

the „intuitive operation“– the complete control cabinet including panel can be positioned quite flexibly, thanks to a four-meter long supply line. Always „in the front line“: Hennecke's sophisticated ML and MX mixheads.

Efficiency and flexibility are also ensured by a new production concept covering the most diverse PU spray technologies. PUR-CSM (PUR-Composite Spray Moulding) comprises the production of non-reinforced or fibre-reinforced components and compound mouldings made of

unfilled or filled PU systems. The result is an excellent process-specific range of moulding properties.

Hennecke's management also anticipates a positive impact through its Scandinavian sales partners. Together with Bayer MaterialScience's system houses BaySystems NorthernEurope A/S and BaySystems BÜFA, local customers attending the fair will benefit from service on the spot and raw materials provided by a system network.
