

## HENNECKE PRESS RELEASE

# **Bergler GmbH & Co. KG Schaumstofftechnologie inaugurates new PU production facility**

It was only in December 2007 that foam product manufacturer Bergler GmbH & Co. KG Schaumstofftechnik placed their order for an oval conveyor system and accessories with Hennecke GmbH. This new production facility will in the future be used to manufacture the back seats of the new Passat CC. It took a record-breaking six months for the entire plant to be designed, assembled and successfully tested at Hennecke's factory in Birlinghoven. At the same time, Bergler built a new production hall at its Oebisfelde site which will be the new place of activity.

During the project realisation phase the plant units were engineered in joint collaboration by the two partners and optimally integrated into the new production location. This is where the tried and tested MQ 18-4 mixhead technology comes into play, which is widely used in the automotive supply industry. The production system offers all kinds of variable process parameters, from the raw material supply and tank storage facilities to the secondary production processes such as the reticulation process using a vacuum crusher.

"The investment in the plant technology and the construction of this new production facility is a clear sign of confidence in Germany as a business location", says Carsten Unverricht, managing director of Bergler Schaumstofftechnik.

Again, Hennecke stands for one-stop consulting and support services, from the conceptual phase to the finished production site. We wish our customer Bergler Schaumstofftechnik all the best and many successful projects to come.
