

PRESS RELEASE

High visitor interest at Fakuma - Hennecke takes positive stock of its trade fair appearance

Hennecke GmbH can look back on a successful performance at one of the most important plastics fairs in the German-speaking world. The machine and plant manufacturer from Sankt Augustin near Bonn presented its new generation of proven TOPLINE HK metering machines at the Fakuma fair as well as a practice-oriented training and seminar program from its 360° Service portfolio.

After evaluating many discussions with customers and visitors, it is clear that our performance at this year's Fakuma fair was a complete success in spite of the global financial crisis. The many

visitors were especially interested in the CSM spraying technology, whose attractiveness remains unbroken thanks to the many application possibilities, as well as in the new TOPLINE HK, a synonym for top-class high-pressure PU processing all over the world. The current generation of the series has a revised machine design and optimized configuration variants. High-quality metering and mixing technology is still on board as well as an intuitive and user-friendly control system. What is new are mixheads from the MT series and a control system with a 15-inch touchscreen panel.

The TOPLINE HK forms the basis of Hennecke's new metering machine philosophy, which places special emphasis on user requirements. From basic configurations with customised standardization of different components and specifically configured standard options to high-end machines.

Thus, PU processors can cover a variety of applications and enjoy decisive advantages without quality being compromised. Because the standard configuration has already been upgraded significantly compared to the previous BASELINE series, the TOPLINE has become much more attractive to small companies or newcomers. TOPLINE customers also get real added value in terms of special requirements. With its comprehensive portfolio of standard options, the TOPLINE HK can be adapted for use in many common applications, meeting the same, extremely short delivery times and maintaining its convincing price-performance ratio. On top of the standard delivery program, the new metering machine philosophy still leaves enough room for almost indefinite PU processing possibilities.

Besides state-of-the-art processing technology, the

fair visitors were also able to find out about Hennecke's "fit for PUR" expanded 360° Service. The 360° training sessions offer PU processors access to a comprehensive training and seminar program at competitive conditions. The aim of the practice-oriented courses, which take place in the new in-house training centre, is to significantly boost productivity and work quality. In this way, production is optimised and maintenance costs can be kept at a low level.

Not only high visitor interest accounts for the positive results of Hennecke's Fakuma performance. Various concrete projects were envisioned and even partly concluded during the fair.
