

New Hennecke representation in Brazil

As from the beginning of this year, Hennecke – a world's leading supplier of polyurethane processing machines and technologies– is represented in Brazil by RoWe in São Paulo.

Hennecke GmbH supplies polyurethane technology and services to its Brazilian customers, specifically in the business sectors of slabstock, refrigerated appliances, sandwich panels and mouldings/automotive. RoWe has many years of experience and market know-how in the field of polyurethane processing. From now on, Hennecke is joining forces with RoWe to provide a quick and efficient full-range service to its customers. Hennecke strives to strengthen its competitive position in Brazil by introducing two systems in particular: BaseLine, a high-pressure metering machine and BFM Compact, a slabstock production line.

BaseLine high-pressure machine – a high-tech system for small companies and newcomers

Hennecke's BaseLine system is based on a compact, low-maintenance design and ultra-modern mixhead technology for PU mixing. The BaseLine nevertheless comes at a high degree of standardization. BaseLines are therefore available at an attractive purchase price so that particularly small firms and newcomers now have inexpensive access to high-pressure technology. A separate control panel permits user-friendly, easy operation. The machine has low space requirements and can be repositioned easily. Since its market launch three years ago, BaseLine sales figures have continuously grown.

BFM Compact slabstock line – minimum installation space, fast start-up and flexible production

BFM Compact is a discontinuously operating production line for making slabstock. The round or rectangular blocks of foam can be made into many different end products, such as mattresses, upholstered furniture and profile parts for packaging. The name of the production line is a reference to its extremely compact design. The entire machine consists of only one frame, on which all assemblies are mounted. Only the day tanks for isocyanate and polyol need to be connected separately. This reduces space

requirements to a minimum, and the line can be installed and started-up quickly (plug & play principle). Further benefits of the BFM Compact are its user-friendly, menu-driven operation and that it produces next to no waste. The numerous advantages of this line are the basis for cost-effective production, which in turn facilitates competitive pricing.
